Data Abstraction

Here we will introduce the concept of organising data items and how we can establish a relationship between data elements. We often talk about data types, a specific kind of data, when programmers define the data set so computers can understand. Some data types are built-in data types and are also recognised by the operating system and can perform processing on these data sets when instructed. In this section of the presentation we will learn about these data types and data structure used for data organisation.
